Documentation

Introduction

The Photonics Abstraction Layer (PAL) is intended to provide an API functions to aid the development of applications.

Overview

This document is intended to aid in the development of applications around PAL sensor family and describes the various API functions provided by the API delivered by ST as open source C code.

Some of the API files are hardware and platform dependent (specially I2C access) so need to be adapted to the platform used by the customer.

Device Info from API

The API provide a function that can be used to obtain information of the device used like the cut version. This function is [VL53L0X_GetDeviceInfo\(\)](#).

Coding Standards

The implementation of this API will follow Linux Kernel rules as defined in <https://www.kernel.org/doc/Documentation/CodingStyle>

Platform

All API settings that are platform-dependent must be adapted to the platform on which API is compiled/running.

This is done in [VL53L0X_platform.h](#) file. Platform settings are described in the [VL53L0X Platform Functions](#) module.

1. PAL device type definition

User must provide [VL53L0X_Dev_t](#) type (in [VL53L0X_platform.h](#) file) as all API functions and macros rely on [VL53L0X_Dev_t dev](#) (given as first argument). This **dev** object does the link between API and platform abstraction layer and is passed from function to function down to final platform abstraction layer that handles final access to the device :

```
int VL53L0X_XXXX(VL53L0X_Dev_t dev, ...)
```

In single device case, **dev** can be as simple as an integer being the i2c device address

For more elaborated platform, **dev** can be a pointer to a structure containing all necessary items for the platform.

2. Read & Write access

API low-level functions rely on a few set of read & write functions which perform the access to the device. These functions must be implemented with respect to the platform on which API is compiled and running. Internal PAL register access functions should be used :

- [VL53L0X WriteMulti\(\)](#)
- [VL53L0X ReadMulti\(\)](#)
- [VL53L0X WrByte\(\)](#)
- [VL53L0X WrWord\(\)](#)
- [VL53L0X WrDWord\(\)](#)
- [VL53L0X UpdateByte\(\)](#)
- [VL53L0X RdByte\(\)](#)
- [VL53L0X RdWord\(\)](#)
- [VL53L0X RdDWord\(\)](#)
-

3. Data Types declaration

API functions rely on data types which are defined in [VL53L0X_types.h](#) file (under **platform/template** directory). This file may require user attention and porting in case of warning messages.

4. Delay for polling operations

API polling high level functions do call the function [VL53L0X PollingDelay\(\)](#) inside their while loop. A default implementation of the [VL53L0X PollingDelay\(\)](#) function is provided. You may decide to change and implement your own [VL53L0X PollingDelay\(\)](#) function.

5. API logging

All API functions entry and leave can be logged to help debugging issues. By default logging is disabled please define VL53L0X_LOG_ENABLE at compilation level. If logging is enabled, a small set of macros must be implemented to adapt logging operation to the platform : [LOG_FUNCTION_START](#) , [LOG_FUNCTION_END](#) and [LOG_FUNCTION_END_FMT](#)

RangeStatus

The Range Status is contained in the [VL53L0X RangingMeasurementData_t](#) and give the quality of the latest ranging.

This is a 8 bit data which contains the following fields:

Value 0 = Range Valid

This value indicate that the ranging is valid.

Value 1 = Sigma Fail

This value indicate that the sigma limit check has failed. Use the function [VL53L0X SetLimitCheckEnable\(\)](#) and [VL53L0X SetLimitCheckValue\(\)](#) to manage the limit.

Value 2 = Signal Fail

This value indicate that the signal check has failed. This can happens when there is no target or when the Range Ignore threshold check has failed. Use the function [VL53L0X_SetLimitCheckEnable\(\)](#) and [VL53L0X_SetLimitCheckValue\(\)](#) to manage the limit.

Value 3 = Min Range Fail

This value indicate that the min range check has failed. Use the function [VL53L0X_SetLimitCheckEnable\(\)](#) and [VL53L0X_SetLimitCheckValue\(\)](#) to manage the limit.

Value 4 = Phase Fail

This value indicate that the Phase check has failed.

Value 5 = HardWare Fail

This value indicate that the Hardware check has failed.

Value 255 = None

No Update

Strings

The API uses character strings to inform the user about the state of the API, the meaning of the error or about the name of a particular mode.

1. String can be removed

At compilation stage a DEFINE can be used to remove all the strings to save some space on device. Strings will be replaced with empty string.

The Define to be used is USE_EMPTY_STRING:

- if USE_EMPTY_STRING is defined: all the strings are replaced with empty string.
- if USE_EMPTY_STRING is NOT defined: all the strings are well defined and not empty.

2. Max Lenght String

The API uses the macro VL53L0X_COPYSTRING to copy strings. For example the following code from get device info

```
VL53L0X_COPYSTRING(pVL53L0X_DeviceInfo->Type,
    VL53L0X_STRING_DEVICE_INFO_TYPE);
```

This MACRO is defined inside platform code. This means that is the responsibility of the customer to use the right function to copy the string. In the Platform gives as example this is:

```
#define VL53L0X_COPYSTRING(str, ...) strcpy(str, ## __VA_ARGS__)
```

In previous example we copy the string defined in VL53L0X_STRING_DEVICE_INFO_TYPE in a field in a structure pVL53L0X_DeviceInfo->Type. This is defined with a max lenght:

```
char Type[VL53L0X_MAX_STRING_LENGTH];
```

In that case by construction the Define:

```
len(VL53L0X_STRING_DEVICE_INFO_TYPE) < VL53L0X_MAX_STRING_LENGTH.
```

In the API the max lenght is defined in the VL53L0X_api_def.h as follow:

```
#define VL53L0X_MAX_STRING_LENGTH 32
```

In the API there are some functions which output directly the string like the following:

```
VL53L0X_Error VL53L0X_GetRangeStatusString(uint8_t RangeStatus,
char *pRangeStatusString)
```

Even in that case a copy string is done. To avoid overflow problem when the copy is done, the string which will contains the one is copied, should be greather or equal to the max lenght described before.

```
void print_range_status(VL53L0X_RangingMeasurementData_t* pRangingMeasurementData){
    char buf[VL53L0X_MAX_STRING_LENGTH];
    uint8_t RangeStatus;

    RangeStatus = pRangingMeasurementData->RangeStatus;

    VL53L0X_GetRangeStatusString(RangeStatus, buf);
    printf("Range Status: %i : %s\n", RangeStatus, buf);
}
```
